

School Habitat Garden (CBSE Kaushal Bodh Class 7)

Introduction

A School Habitat Garden is a small garden created within the school campus where students grow and care for plants, vegetables, herbs, flowers, and native species. It serves as a living laboratory that connects classroom learning with nature through observation and hands-on activities.

What is a School Habitat Garden?

A school habitat garden is a planned green space designed to support plants, insects, birds, butterflies, and other small living organisms. Students participate in planting, watering, composting, and maintaining the garden while learning about biodiversity, sustainability, and environmental conservation.

Importance of a School Habitat Garden

- Develops love and respect for nature.
- Provides practical learning in science and environmental education.
- Helps students understand biodiversity and ecosystems.
- Encourages teamwork, responsibility, and problem-solving.
- Promotes healthy eating by growing vegetables and herbs.
- Supports composting and waste management practices.
- Improves the school environment with cleaner air and greenery.
- Creates habitats for birds, butterflies, bees, and beneficial insects.
- Builds awareness about water conservation and sustainable practices.
- Inspires students to protect the environment in everyday life.
